Managing Meta Data

Use Data Interpreter

To get the clean data in case, of irrelevant rows fetched or to remove null values.

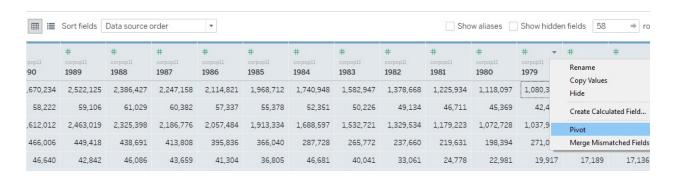

You can review the results of how Tableau has cleaned your data if incorrectly interpreted then, can Undo the changes by unchecking the box.

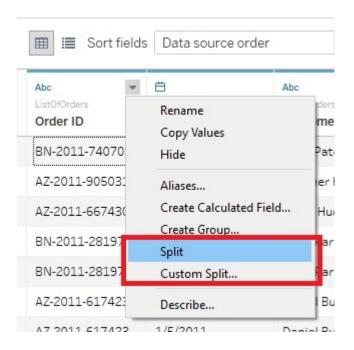

Pivoting the Data

In order to Pivot the data, select the data to be pivoted and right click and press pivot

Using Custom Split

We use split in case where tableau automatically splits the column (In the case below it will take "-" as separator and split the column into 3 different columns)

Whereas, we use custom split in cases where we want to define our own separator and number of columns we want the selected column to split.
